The image displays three overlapping software windows from ChemBio3D:

- ChemBioFinder - [Training_CS-2]:** A search interface showing the results for 3-(AMINOMETHYL)PYRIDINE. The structure is shown in the center, and properties are listed on the right: MolfileName: Structure1, Description: 3-(AMINOMETHYL)PYRIDINE, CASRegNo: 3731-52-0, Marca: Aldrich, Boiling_Point: 466.375, Exact_Mass: 108.069. The left pane shows a tree view of the database structure.
- ChemBio3D:** A 3D ball-and-stick model of a complex organic molecule, likely a protein or a large organic compound, rendered in a ball-and-stick representation.
- Chemical Reaction Pathway:** A diagram illustrating the biosynthesis of dopamine. It starts with tyrosine, which is converted to 3,4-dihydroxyphenylalanine (DOPA) by the enzyme tyrosine hydroxylase, using tetrahydrobiopterin and O₂ as cofactors. DOPA is then converted to dopamine by DOPA decarboxylase, releasing CO₂. Finally, dopamine is converted to norepinephrine by Dopamine β-hydroxylase, using Ascorbate + O₂ as cofactors, producing Dehydroascorbate + H₂O.
